

" A rotating conveyor for the evacuation of metal shavings resulting from machining operations."

Abstract of the description

A rotating conveyor for the evacuation of metal shavings resulting from mechanical work processes, comprising a collecting container (2) in which a motorised basket (4) is rotating, above whose bottom wall (5) the lower end (12) of an evacuation conduit (11) connected to an aspiration unit is positioned. A blade stationary conveyor member (13), angularly adjustable, extends between the vertical axis of rotation (A) of the basket (4) and the lower end (12) of the evacuation conduit (11) to convey the shavings below it.
